Power Brake is now offering a Cat air compressor conversion kit.

If you are experiencing oil passing with your model 270/EL365 Haldex style air compressor in use on various Cat engines, it is very possibly due to the air intake plumbing configuration. Most compressors today use positive pressure on the air intake of the compressor, and in the 2006-2007 time frame, Cat changed the plumbing to natural aspiration, or negative pressure causing a vacuum effect on the compressor. This change resulted in increased oil passing into the air brake system on many vehicles.

Power Brake is now promoting a solution to this issue by way of a conversion kit that will effectively change the compressor intake to positive pressure by utilizing the engine turbo air feeding the engine intake. This change requires that if an inlet check valve is utilized, either in the inlet port of the head, or in-line, it must be removed. Some rebuilders today are making this kit installation a mandatory change as part of the warranty they offer on the air compressor.
